

State-level multivariate model

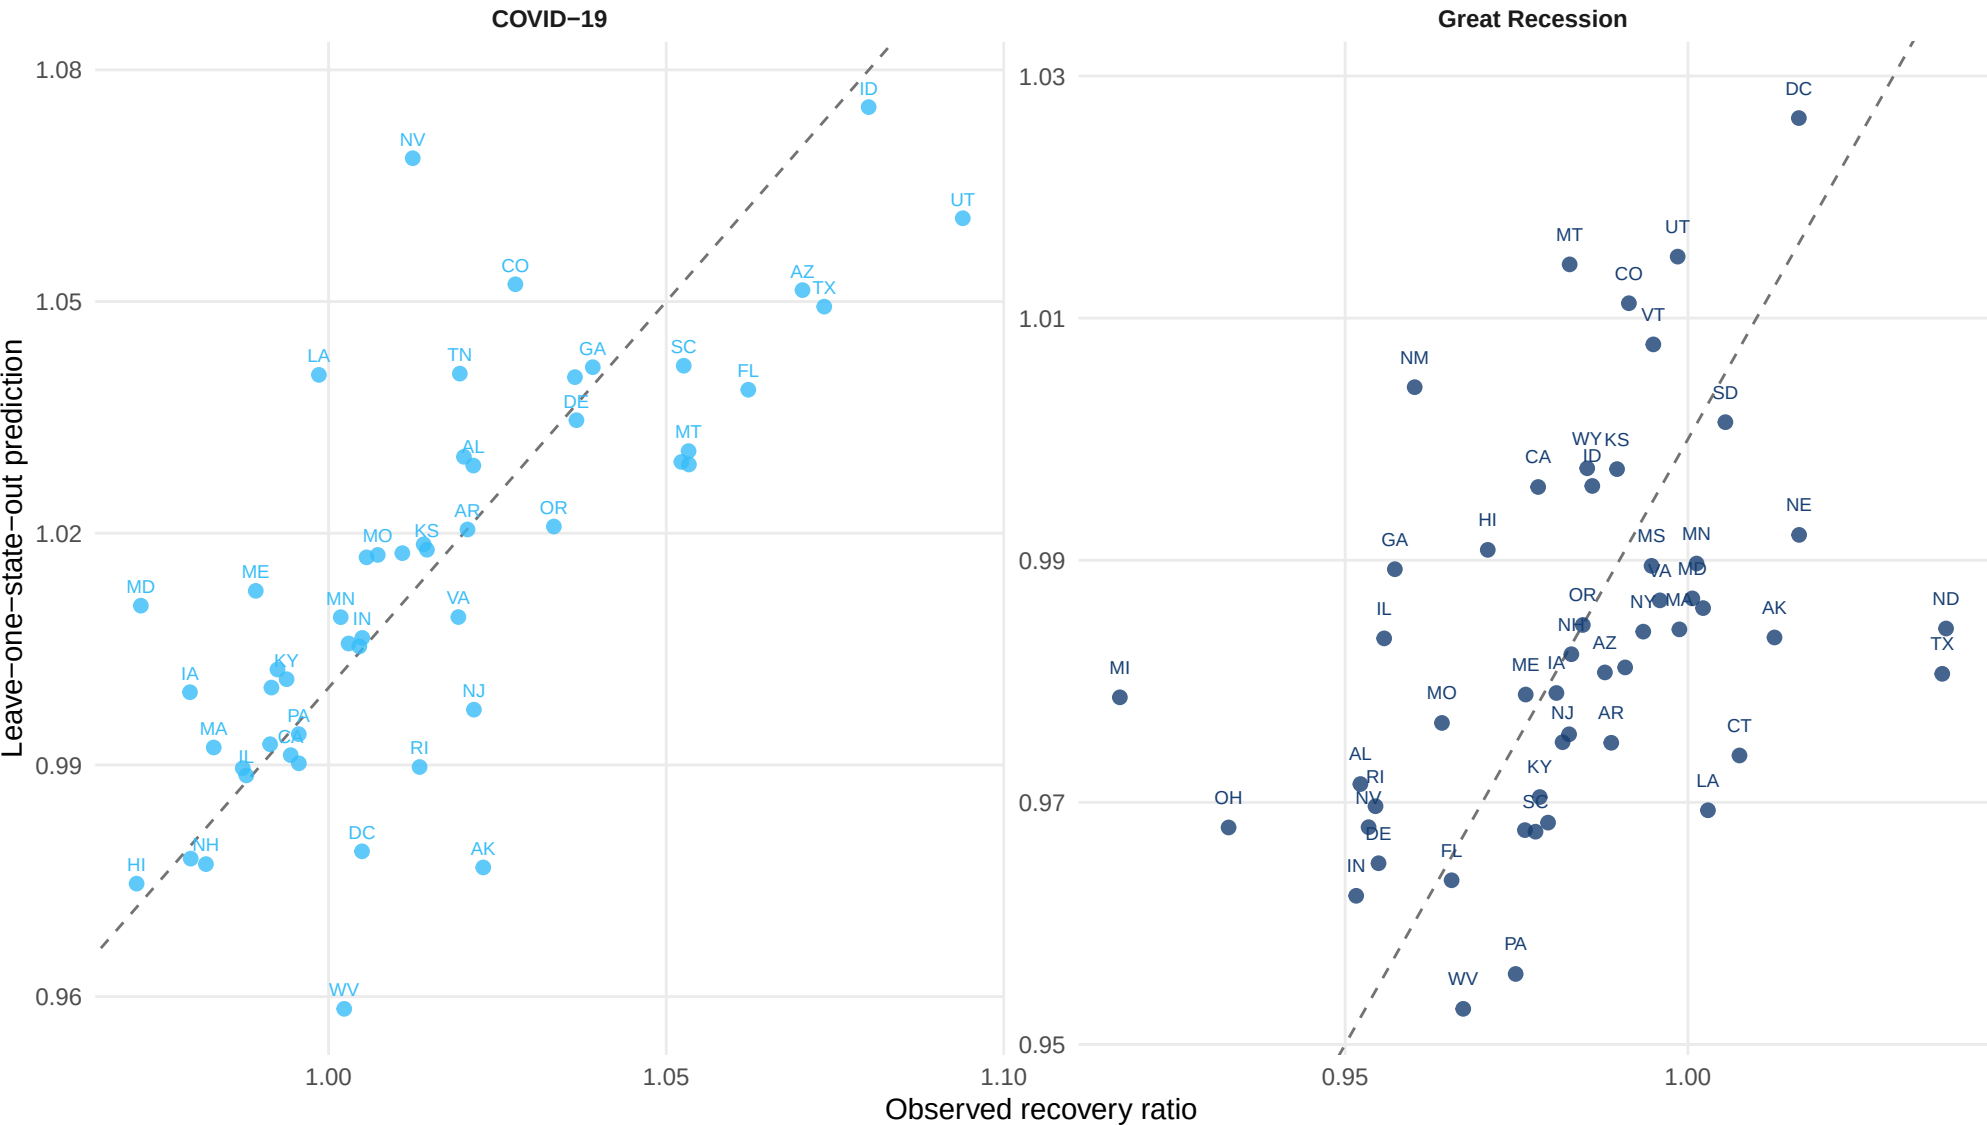

Standardized OLS coefficients with 95% confidence intervals

Interpret cautiously: each crisis model contains only 51 state/DC observations.

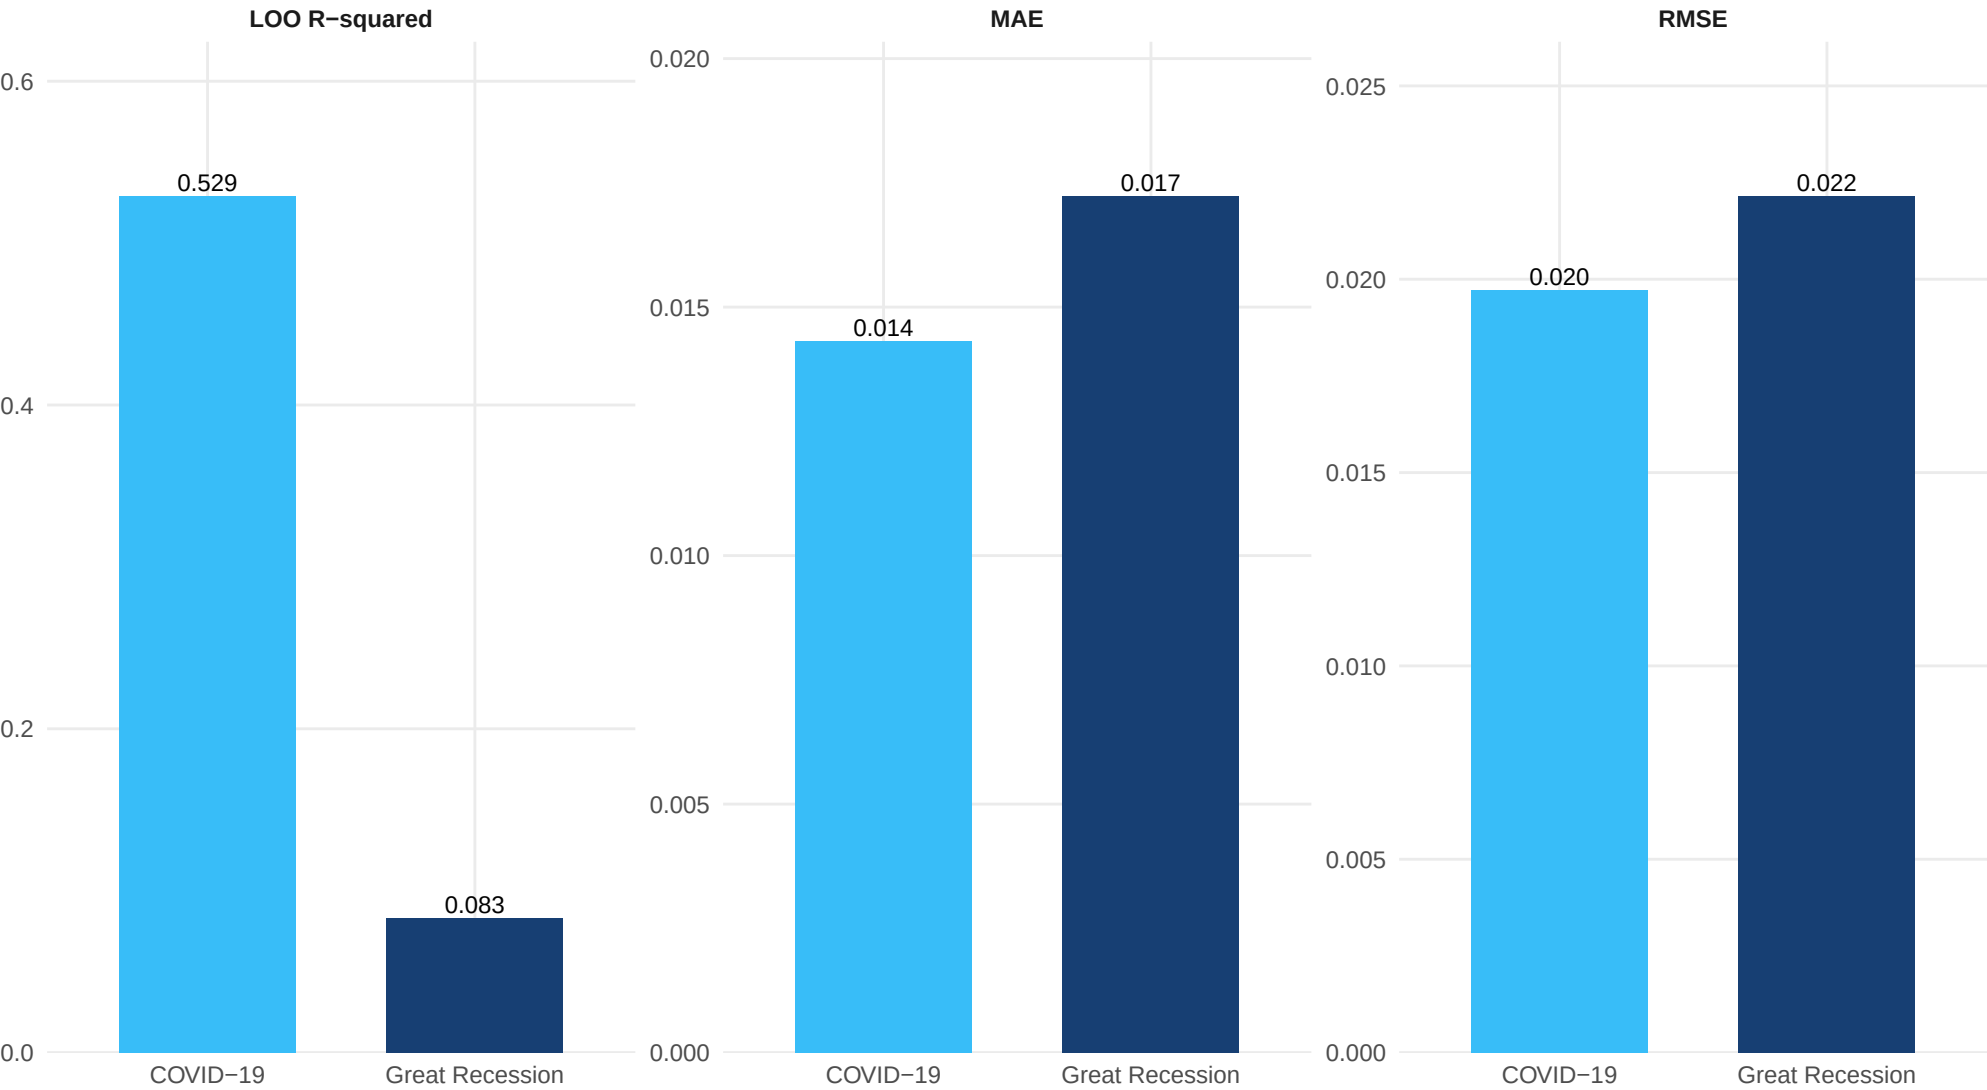

State recovery: observed versus cross-validated prediction

Each state is predicted by a model trained on the other 50 states/DC

State OLS performance

Leave-one-state-out cross-validation

Lower RMSE and MAE are better; higher LOO R-squared is better.

State OLS residuals and influential observations

Larger circles have greater Cook's distance
